Collaborator ...

Our project should be able to find a user record in the users table from our database. It finding user based on the email. The purpose is to check if the user exists or not.

I also created test function for finding user record based on the company email.

To test: run the backend server and open <http://localhost:3001/auth/find-user?email=test@futureandsuns.com> it should shows a test user that I created in the database

Testing

The test client data was found from the database and displayed on the backend page.
